The exercises

73. Give regular expressions for the following languages over the alphabet $\Sigma = \{0,1\}$.

    (a) $\{w \mid w$ begins with a `1` and ends with a `0`$\}$

    (b) $\{w \mid w$ contains t x and $y)$

    (c) $\{w \mid w$ has length

    (d) $\{w \mid$ the length of

    (e) $\{w \mid w$ is any string except `11` and `111`$\}$

    (f) $\{w \mid$ every odd position of w is a `1`$\}$

    (g) $\{w \mid w$ contains at least two `0`s and at most one `1`$\}$

    (h) $\{\epsilon, 0\}$

    (i) The empty set

    (j) All strings except the empty string

74. String s is a *suffix* t u mpty) such that $t = us$.
    For any language

    Let A be any regular language. Show that *suffix*   hink about
    how a DFA for A can be transformed to recognise

75. In general it is difficult, given a regular expression, to find a regular expression for its complement. However, it can be done, and you have been given all the necessary tricks and algorithms. This question asks you to go through the required steps for a particular example.

    Consider the regular language $(\mathtt{ba}^*\mathtt{a})^*$. Assuming the alphabet is $\Sigma = \{\mathtt{a}, \mathtt{b}\}$, we want to find a regular expression for its complement, that is, for

    $$L = \{w \in \{\mathtt{a}, \mathtt{b}\}^* \mid w \text{ is not in } (\mathtt{ba}^*\mathtt{a})^*\}$$

    To complete this task, go through the following steps.

    (a) Construct an NFA for $(\mathtt{ba}^*\mathtt{a})^*$. Two states suffice.

    (b) Turn the NFA into a DFA using the subset construction method.

    (c) Do the "complement trick" to get a DFA D for L.

    (d) Reflect on the result: Wouldn't it have been better/easier to apply the "complement trick" directly to the NFA?

    (e) Turn DFA D into a regular expression for L using the NFA-to-regular-expression translation shown in the lecture on regular expressions (not examinable).

76. A *palindrome* is a string that reads the same forwards and backwards. Use the pumping lemma for regular languages and/or closure results to prove that the following languages are not regular:

    (a) $A = \{\mathtt{0}^n\mathtt{1}^n\mathtt{2}^n \mid n \geq 0\}$

    (b) $B = \{\mathtt{a}^i\mathtt{ba}^j \mid i > j \geq 0\}$

(c) $C = \{w \in \{\mathtt{a},\mathtt{b}\}^* \mid w \text{ is not a palindrome}\}$

77. Give context-free grammars for the following languages. Assume the alphabet is $\Sigma = \{\mathtt{0},\mathtt{1}\}$.

    (a) $\{w \mid w \text{ starts and ends with the same symbol}\}$

    (b) $\{w \mid \text{the length of } w \text{ is odd}\}$

    (c) $\{w \mid \text{the length of } w \text{ is odd and its middle symbol is } \mathtt{0}\}$

    (d) $\{w \mid w \text{ is a palindrome}\}$

78. Construct a context-free grammar for the language $\{\mathtt{a}^i\mathtt{ba}^j \mid i > j \geq 0\}$.

79. Show that the class of context-   rations: union,
concatenation, and K   n A and B can
be manipulated to produc A^*. Careful: The
variables used in the grammars for A and in B could overlap.

80. If we consider English words the "symbols" (or primitives) of English, we can use a context-free grammar to try to capture certain classes of sentences and phrases. For example, we can consider articles (A), nouns (N), adjectives (Q), in   ansitive verbs
(TV), noun phrases (NP), verb phrases (VP), and sent   rces gen-
erated by this grammar:

S				V	$\rightarrow$	hides
A				V	$\rightarrow$	runs
A				V	$\rightarrow$	sleeps
NP				TV	$\rightarrow$	chases
NP	$\rightarrow$	$A\,Q\,N$	VP	$\rightarrow$		$\rightarrow$	hides
N	$\rightarrow$	bone	VP	$\rightarrow$		$\rightarrow$	likes

Are they all meaningful? Discuss "well-formed" versus "m

81. How would you change the grammar from the previous question so that "adverbial modifiers" such as "angrily" or "happily" can be used? For example, we would like to be able to generate sentences like "the dog barks constantly" and "the black cat sleeps quietly".

82. Consider this context-free grammar G with start symbol S:

$$\begin{aligned} S &\rightarrow \mathtt{a\,b\,a} \mid \mathtt{a\,b}\,A \mid \mathtt{b}\,B \\ A &\rightarrow \mathtt{b} \mid \mathtt{b}\,A \mid \mathtt{a}\,B \\ B &\rightarrow \mathtt{a}\,A \mid \mathtt{a}\,B \end{aligned}$$

Draw an NFA which recognises $L(G)$. Hint: The grammar is a regular grammar; you may want to use the labels S, A, and B for three of the NFA's states.

83. Consider the context-free grammar G with rules

$$S \rightarrow \mathtt{a\,b} \mid \mathtt{a}\,S\,\mathtt{b} \mid S\,S$$

Use structural induction to show that no string $w \in L(G)$ starts with $\mathtt{abb}$.

84. (Drill.) Consider the context-free grammar $(\{S\}, \{\mathtt{a},\mathtt{b}\}, R, S)$ with rules R:

$$S \rightarrow \mathtt{a} \mid \mathtt{b} \mid S\,S$$

Show that the grammar is ambiguous; then find an equivalent unambiguous grammar.

85. (Drill.) Consider the context-free grammar $(\{A, B, T\}, \{\texttt{a}, \texttt{b}\}, R, T)$ with rules R:

$$
\begin{aligned}
T &\rightarrow A \mid B \\
A &\rightarrow \texttt{a}\,\texttt{b} \mid \texttt{a}\,A\,\texttt{b} \\
B &\rightarrow \epsilon \mid \texttt{a}\,\texttt{b}\,B
\end{aligned}
$$

Show that the grammar is ambiguous; then find an equivalent unambiguous grammar.

86. (Drill.) Give a context-free grammar for the language recognised by this DFA:
